

The Comprehensive L^AT_EX Symbol List

Scott Pakin <pakin@uiuc.edu>*

8 October 2002

Abstract

This document lists 2590 symbols and the corresponding L^AT_EX commands that produce them. Some of these symbols are guaranteed to be available in every L^AT_EX 2_ε system; others require fonts and packages that may not accompany a given distribution and that therefore need to be installed. All of the fonts and packages used to prepare this document—as well as this document itself—are freely available from the Comprehensive T_EX Archive Network (<http://www.ctan.org>).

1 Introduction

Welcome to the Comprehensive L^AT_EX Symbol List! This document strives to be your primary source of L^AT_EX symbol information: font samples, L^AT_EX commands, packages, usage details, caveats—everything needed to put thousands of different symbols at your disposal. All of the fonts covered herein meet the following criteria:

1. They are freely available from the Comprehensive T_EX Archive Network (<http://www.ctan.org>).
2. All of their symbols have L^AT_EX 2_ε bindings. That is, a user should be able to access a symbol by name, not just by `\char⟨number⟩`.

These are not particularly limiting criteria; the Comprehensive L^AT_EX Symbol List contains samples of 2590 symbols—quite a large number. Some of these symbols are guaranteed to be available in every L^AT_EX 2_ε system; others require fonts and packages that may not accompany a given distribution and that therefore need to be installed. See <http://www.tex.ac.uk/cgi-bin/texfaq2html?label=instpackages+wherefiles> for help with installing new fonts and packages.

1.1 Document Usage

Each section of this document contains a number of font tables. Each table shows a set of symbols, with the corresponding L^AT_EX command to the right of each symbol. A table’s caption indicates what package needs to be loaded in order to access that table’s symbols. For example, the symbols in Table 21, “textcomp Old-Style Numerals”, are made available by putting “`\usepackage{textcomp}`” in your document’s preamble. “*AMS*” means to use the *AMS* packages, viz. `amssymb` and/or `amsmath`. Notes below a table provide additional information about some or all the symbols in that table.

One note that appears a few times in this document, particularly in Section 2, indicates that certain symbols do not exist in the OT1 font encoding (Donald Knuth’s original, 7-bit font encoding, which is the default font encoding for L^AT_EX) and that you should use `fontenc` to select a different encoding, such as T1 (a common 8-bit font encoding). That means that you should put “`\usepackage[⟨encoding⟩]{fontenc}`” in your document’s preamble, where `⟨encoding⟩` is, e.g., T1 or LY1. To limit the change in font encoding to the current group, use “`\fontencoding{⟨encoding⟩}\selectfont`”.

Section 7 contains some additional information about the symbols in this document. It shows which symbol names are not unique across packages, gives examples of how to create new symbols out of existing symbols, explains how symbols are spaced in math mode, presents a L^AT_EX ASCII and Latin 1 tables, and provides some information about this document itself. The Comprehensive L^AT_EX Symbol List ends with an index of all the symbols in the document and various additional useful terms.

1.2 Frequently Requested Symbols

There are a number of symbols that are requested over and over again on `comp.text.tex`. If you’re looking for such a symbol the following list will help you find it quickly.

_, as in “Spaces_are_significant.”	7	⋯	33
í, ì, î, î, etc. (versus í, ì, î, and î)	10	°, as in “180°” or “15°C”	34
¢	12	<i>L</i> , <i>F</i> , etc.	35
€	13	N, Z, R, etc.	35
©, ®, and ™	13	á, è, etc. (i.e., several accents per character)	52
‰	14	<i>f</i>	50
ℱ	19	< and > (instead of j and i)	53
∴	20	~ (or ~)	53
:= and ::=	21		

2 Body-text symbols

This section lists symbols that are intended for use in running text, such as punctuation marks, accents, ligatures, and currency symbols.

TABLE 1: L^AT_EX 2_ε Escapable “Special” Characters

\$	\\$	%	\%	-	_	}	\}	&	\&	#	\#	{	\{
----	-----	---	----	---	----	---	----	---	----	---	----	---	----

TABLE 2: L^AT_EX 2_ε Commands Defined to Work in Both Math and Text Mode

\$	\\$	-	_	‡	\ddag	{	\{
¶	\P	©	©	...	\dots	}	\}
§	\S	†	\dag	£	\pounds		

Where two symbols are present, the left one is the “faked” symbol that L^AT_EX 2_ε provides by default, and the right one is the “true” symbol that textcomp makes available.

TABLE 3: Predefined L^AT_EX 2_ε Text-Mode Commands

^	\textasciicircum	<	\textless
~	\textasciitilde	ª	\textordfeminine
*	\textasteriskcentered	º	\textordmasculine
\	\textbackslash	¶	\textparagraph
	\textbar	.	\textperiodcentered
{	\textbraceleft	¿	\textquestiondown
}	\textbraceright	“	\textquotedblleft
•	\textbullet	”	\textquotedblright
©	\textcopyright	‘	\textquoteleft
†	\textdagger	,’	\textquoteright
‡	\textdaggerdbl	®	\textregistered
\$	\textdollar	§	\textsection
...	\textellipsis	£	\textsterling
—	\textemdash	™	\texttrademark
-	\textendash	-	\textunderscore
!	\textexclamdown	␣	\textvisiblespace
>	\textgreater		

Where two symbols are present, the left one is the “faked” symbol that L^AT_EX 2_ε provides by default, and the right one is the “true” symbol that textcomp makes available.

TABLE 4: Non-ASCII Letters (Excluding Accented Letters)

å	\aa	Ð	\DH*	L	\L	ø	\o	ß	\ss
Å	\AA	ð	\dh*	l	\l	Ø	\O	SS	\SS
Æ	\AE	Ð	\DJ*	lJ	\NG*	Œ	\OE	Þ	\TH*
æ	\ae	ð	\dj*	lj	\ng*	œ	\oe	þ	\th*

* Not available in the OT1 font encoding. Use the fontenc package to select an alternate font encoding, such as T1.

TABLE 5: Letters Used to Typeset African Languages

Đ	<code>\B{D}</code>	ċ	<code>\m{c}</code>	f	<code>\m{f}</code>	k	<code>\m{k}</code>	t	<code>\M{t}</code>	Ƶ	<code>\m{Z}</code>
đ	<code>\B{d}</code>	Đ	<code>\m{D}</code>	F	<code>\m{F}</code>	Đ	<code>\m{N}</code>	T	<code>\M{T}</code>	Ė	<code>\T{E}</code>
H	<code>\B{H}</code>	ċ	<code>\M{d}</code>	Ƴ	<code>\m{G}</code>	ŋ	<code>\m{n}</code>	ƒ	<code>\m{t}</code>	ē	<code>\T{e}</code>
h	<code>\B{h}</code>	Đ	<code>\M{D}</code>	Ƴ	<code>\m{g}</code>	ɔ	<code>\m{o}</code>	T	<code>\m{T}</code>	Ō	<code>\T{O}</code>
t	<code>\B{t}</code>	đ	<code>\m{d}</code>	l	<code>\m{l}</code>	Ɔ	<code>\m{O}</code>	u	<code>\m{u}*</code>	ō	<code>\T{o}</code>
T	<code>\B{T}</code>	Ė	<code>\m{E}</code>	ı	<code>\m{i}</code>	P	<code>\m{P}</code>	U	<code>\m{U}*</code>		
b	<code>\m{b}</code>	ε	<code>\m{e}</code>	N	<code>\m{J}</code>	p	<code>\m{p}</code>	Y	<code>\m{Y}</code>		
B	<code>\m{B}</code>	Ǝ	<code>\M{E}</code>	ɲ	<code>\m{j}</code>	ƒ	<code>\m{s}</code>	y	<code>\m{y}</code>		
C	<code>\m{C}</code>	ə	<code>\M{e}</code>	K	<code>\m{K}</code>	ƒ	<code>\m{S}</code>	ƶ	<code>\m{z}</code>		

These characters all need the T4 font encoding, which is provided by the `fc` package.

* `\m{v}` and `\m{V}` are synonyms for `\m{u}` and `\m{U}`.

TABLE 6: Punctuation Marks Not Found in OT1

«	<code>\guillemotleft</code>	<	<code>\guilsinglleft</code>	„	<code>\quotedblbase</code>	"	<code>\textquotedbl</code>
»	<code>\guillemotright</code>	>	<code>\guilsinglright</code>	,	<code>\quotesinglbase</code>		

To get these symbols, use the `fontenc` package to select an alternate font encoding, such as T1.

TABLE 7: pifont Decorative Punctuation Marks

‘	<code>\ding{123}</code>	“	<code>\ding{125}</code>	¶	<code>\ding{161}</code>	♥	<code>\ding{163}</code>
’	<code>\ding{124}</code>	”	<code>\ding{126}</code>	•	<code>\ding{162}</code>

tipa defines shortcut characters for many of the above. It also defines a command \tone for denoting tone letters (itches). See the tipa documentation for more information.

Ââ	\newtie{A}\newtie{a}*	Ⓐⓐ	\textcircled{A}\textcircled{a}				

* Requires the textcomp package.

† Not available in the OT1 font encoding. Use the fontenc package to select an alternate font encoding, such as T1.

‡ Requires the T4 font encoding, provided by the fc package.

Also note the existence of \i and \j, which produce dotless versions of “i” and “j” (viz., “i” and “j”). These are useful when the accent is supposed to replace the dot. For example, “na\“{\i}ve” produces a correct “naïve”, while “na\{i}ve” would yield the rather odd-looking “naïve”. (“na\“{i}ve” *does* work in encodings other than OT1, however.)

$\grave{A}$	$\grave{a}$	<code>\textvbaraccent{A}</code>	<code>\textvbaraccent{a}</code>

`tipa` defines shortcut sequences for many of the above. See the `tipa` documentation for more information.

TABLE 13: `wsuipa` Text-Mode Accents

$\underset{\cdot}{A}$	$\underset{\cdot}{a}$	<code>\dental{A}</code>	<code>\dental{a}</code>
$\underset{\cdot}{A}$	$\underset{\cdot}{a}$	<code>\underarch{A}</code>	<code>\underarch{a}</code>

TABLE 14: `wsuipa` Diacritics

$\acute{a}$	<code>\ain</code>	$\acute{a}$	<code>\leftp</code>	$\acute{a}$	<code>\overring</code>	$\acute{a}$	<code>\stress</code>	$\acute{a}$	<code>\underwedge</code>
$\corner{a}$	<code>\corner</code>	$\left{a}$	<code>\leftt</code>	$\left{a}$	<code>\polishhook</code>	$\left{a}$	<code>\syllabic</code>	$\left{a}$	<code>\upp</code>
$\down{a}$	<code>\downp</code>	length	<code>\length</code>	$\right{a}$	<code>\rightp</code>	underdots	<code>\underdots</code>	upt	<code>\upt</code>
downt	<code>\downt</code>	midtilde	<code>\midtilde</code>	rightt	<code>\rightt</code>	underring	<code>\underring</code>		
halflength	<code>\halflength</code>	open	<code>\open</code>	secstress	<code>\secstress</code>	undertilde	<code>\undertilde</code>		

The `wsuipa` package defines all of the above as ordinary characters, not as accents. However, it does provide `\diatop` and `\diaunder` commands, which are used to compose diacritics with other characters. For example, `\diatop[\overring|a]` produces “ $\acute{a}$ ”, and `\diaunder[\underdots|a]` produces “ $\underset{\cdot}{a}$ ”. See the `wsuipa` documentation for more information.

TABLE 15: `textcomp` Diacritics

acutedbl	<code>\textacutedbl</code>	asciicaron	<code>\textasciicaron</code>	asciimacron	<code>\textasciimacron</code>
asciiacute	<code>\textasciiacute</code>	asciidieresis	<code>\textasciidieresis</code>	gravedbl	<code>\textgravedbl</code>
asciibreve	<code>\textasciibreve</code>	asciigrave	<code>\textasciigrave</code>	tildedown	<code>\texttildedown</code>

The `textcomp` package defines all of the above as ordinary characters, not as accents.

TABLE 16: `textcomp` Currency Symbols

baht	<code>\textbaht</code>	dollar	<code>\textdollar</code>	guarani	<code>\textguarani</code>	won	<code>\textwon</code>
cent	<code>\textcent</code>	dollaroldstyle	<code>\textdollaroldstyle</code>	lira	<code>\textlira</code>	yen	<code>\textyen</code>
centoldstyle	<code>\textcentoldstyle</code>	dong	<code>\textdong</code>	naira	<code>\textnaira</code>		
colonmonetary	<code>\textcolonmonetary</code>	euro	<code>\texteuro</code>	peso	<code>\textpeso</code>		
currency	<code>\textcurrency</code>	florin	<code>\textflorin</code>	sterling	<code>\textsterling</code>		

TABLE 17: marvosym Currency Symbols

₯	<code>\Denarius</code>	€	<code>\EUR</code>	€	<code>\EURdig</code>	€	<code>\EURtm</code>	℔	<code>\Pfund</code>
@	<code>\Ecommerce</code>	€	<code>\EURcr</code>	€	<code>\EURhv</code>	\$	<code>\EyesDollar</code>	β	<code>\Shilling</code>

The different euro signs are meant to be compatible with different fonts—Courier (`\EURcr`), Helvetica (`\EURhv`), Times (`\EURtm`), and the `marvosym` digits listed in Table 117 (`\EURdig`).

TABLE 18: wasysym Currency Symbols

¢	<code>\cent</code>	⌚	<code>\currency</code>
---	--------------------	---	------------------------

TABLE 19: eurosym Euro Signs

€	<code>\geneuro</code>	€	<code>\geneuronarrow</code>	€	<code>\geneurowide</code>	€	<code>\officialeguro</code>
---	-----------------------	---	-----------------------------	---	---------------------------	---	-----------------------------

`\euro` is automatically mapped to one of the above—by default, `\officialeguro`—based on a `eurosym` package option. See the `eurosym` documentation for more information. The `\geneuro...` characters are generated from the current body font’s “C” character and therefore may not appear exactly as shown.

TABLE 20: textcomp Legal Symbols

Ⓟ	<code>\textcircledP</code>	©	©	<code>\textcopyright</code>		SM	<code>\textservicemark</code>
Ⓡ	<code>\textcircleft</code>	®	®	<code>\textregistered</code>	™	™	<code>\texttrademark</code>

Where two symbols are present, the left one is the “faked” symbol that $\text{\LaTeX 2}_{\epsilon}$ provides by default, and the right one is the “true” symbol that `textcomp` makes available.

TABLE 21: textcomp Old-Style Numerals

0	<code>\textzerooldstyle</code>	4	<code>\textfouroldstyle</code>	8	<code>\texteightoldstyle</code>
1	<code>\textoneoldstyle</code>	5	<code>\textfiveoldstyle</code>	9	<code>\textnineoldstyle</code>
2	<code>\texttwooldstyle</code>	6	<code>\textsixoldstyle</code>		
3	<code>\textthreeoldstyle</code>	7	<code>\textsevenoldstyle</code>		

Rather than use the bulky `\textoneoldstyle`, `\texttwooldstyle`, etc. commands shown above, consider using `\oldstylenums{...}` to typeset an old-style number.

TABLE 22: Miscellaneous `textcomp` Symbols

‡	<code>\textinterrobangdown</code>	§	<code>\textsection</code>
♪	<code>\textmusicalnote</code>	—	<code>\textthreequartersemdash</code>
Nº	<code>\textnumero</code>	—	<code>\texttwelveudash</code>

Where two symbols are present, the left one is the “faked” symbol that $\text{\LaTeX 2}_{\varepsilon}$ provides by default, and the right one is the “true” symbol that `textcomp` makes available.

TABLE 23: Miscellaneous `wasysym` Text-Mode Symbols

‰ `\permil`

TABLE 24: $\mathcal{AMS}$ Commands Defined to Work in Both Math and Text Mode

✓ `\checkmark` ® `\circledR` ✠ `\maltese`

3 Mathematical symbols

Most, but not all, of the symbols in this section are math-mode only. That is, they yield a “Missing \$ inserted” error message if not used within $\$ \dots \$$, $\backslash[\dots \backslash]$, or another math-mode environment. Operators marked as “variable-sized” are taller in displayed formulas, shorter in in-text formulas, and possibly shorter still when used in various levels of superscripts or subscripts.

Alphanumeric symbols (e.g., “ $\mathcal{L}$ ” and “ $\mathbb{Z}$ ”) are usually produced using one of the math alphabets in Table 118 rather than with an explicit symbol command. Look there first if you need a symbol for a transform, number set, or some other alphanumeric.

Although there have been many requests on `comp.text.tex` for a contradiction symbol, the ensuing discussion invariably reveals innumerable ways to represent contradiction in a proof, including “ $\blacksquare$ ” (`\blitza`), “ $\Rightarrow \Leftarrow$ ” (`\Rightarrow\Leftarrow`), “ $\perp$ ” (`\bot`), “ $\leftrightarrow$ ” (`\leftrightarrows`), and “ $\ast$ ” (`\textreferencemark`). Because of the lack of notational consensus, it is probably better to spell out “Contradiction!” than to use a symbol for this purpose. Similarly, discussions on `comp.text.tex` have revealed that there are a variety of ways to indicate the mathematical notion of “is defined as”. Common candidates include “ $\triangleq$ ” (`\triangleq`), “ $\equiv$ ” (`\equiv`), “ $\coloneqq$ ” (`\coloneqq`), and “ $\stackrel{\text{def}}{=}$ ” (`\stackrel{\text{def}}{=}`).

$\vee$	<code>\curlyvee</code>	$\blacksquare$	<code>\sqbullet</code>	$\wedge$	<code>\wedge</code>

Many of the above glyphs go by multiple names. `\centerdot` is equivalent to `\sqbullet`, and `\ast` is equivalent to `*`. `\asterisk` produces the same glyph as `\ast`, but as an ordinary symbol, not a binary operator. Similarly, `\bigast` produces a large-operator version of the `\Asterisk` binary operator, and `\bigcoast` produces a large-operator version of the `\coAsterisk` binary operator.

The `\changenotsign` command toggles the behavior of `\not` to produce either a vertical or a diagonal slash through a binary operator. Thus, “`$a \not= b$`” can be made to produce either “ $a \nmid b$ ” or “ $a \neq b$ ”.

TABLE 78: mathabx Extension Characters

$\mathrel{\circlearrowleft}$	<code>\mapsfromchar</code>	$\mathrel{\circlearrowleft}$	<code>\mapstochar</code>
$\mathrel{\circlearrowleft}$	<code>\Mapsfromchar</code>	$\mathrel{\circlearrowleft}$	<code>\Mapstochar</code>

TABLE 79: Log-like Symbols

$\arccos$	<code>\cos</code>	$\csc$	<code>\exp</code>	$\ker$	<code>\limsup</code>	$\min$	<code>\sinh</code>
$\arcsin$	<code>\cosh</code>	$\deg$	<code>\gcd</code>	$\lg$	<code>\ln</code>	$\Pr$	<code>\sup</code>
$\arctan$	<code>\cot</code>	$\det$	<code>\hom</code>	$\lim$	<code>\log</code>	$\sec$	<code>\tan</code>
$\arg$	<code>\coth</code>	$\dim$	<code>\inf</code>	$\liminf$	<code>\max</code>	$\sin$	<code>\tanh</code>

Calling the above “symbols” may be a bit misleading.¹ Each log-like symbol merely produces the eponymous textual equivalent, but with proper surrounding spacing. See Section 7.3 for more information about log-like symbols. As `\bmod` and `\pmod` are arguably not symbols we refer the reader to the Short Math Guide for L^AT_EX [Dow00] for samples.

TABLE 80: $\mathcal{AMS}$ Log-like Symbols

$\injlim$	<code>\injlim</code>	$\varinjlim$	<code>\varinjlim</code>	$\varinjlim$	<code>\varinjlim</code>
$\projlim$	<code>\projlim</code>	$\varprojlim$	<code>\varprojlim</code>	$\varprojlim$	<code>\varprojlim</code>

Load the `amsmath` package to get these symbols. See Section 7.3 for some additional comments regarding log-like symbols. As `\mod` and `\pod` are arguably not symbols we refer the reader to the Short Math Guide for L^AT_EX [Dow00] for samples.

TABLE 81: Greek Letters

α	<code>\alpha</code>	θ	<code>\theta</code>	o	<code>o</code>	τ	<code>\tau</code>
β	<code>\beta</code>	ϑ	<code>\vartheta</code>	π	<code>\pi</code>	υ	<code>\upsilon</code>
γ	<code>\gamma</code>	ι	<code>\iota</code>	ϖ	<code>\varpi</code>	ϕ	<code>\phi</code>
δ	<code>\delta</code>	κ	<code>\kappa</code>	ρ	<code>\rho</code>	φ	<code>\varphi</code>

TABLE 90: $\mathcal{AMS}$ Delimiters

$\ulcorner$	<code>\ulcorner</code>	$\urcorner$	<code>\urcorner</code>
$\llcorner$	<code>\llcorner</code>	$\lrcorner$	<code>\lrcorner</code>

TABLE 91: stmaryrd Delimiters

$\{$	<code>\Lbag</code>	$\}$	<code>\Rbag</code>	$\{$	<code>\lbag</code>	$\}$	<code>\rbag</code>
$\lceil$	<code>\llceil</code>	$\rceil$	<code>\rrceil</code>	$\lfloor$	<code>\llfloor</code>	$\rfloor$	<code>\rrfloor</code>
$\langle$	<code>\llparenthesis</code>	$\rangle$	<code>\rrparenthesis</code>				

TABLE 92: mathabx Delimiters

$\lrcorner$	<code>\lrcorner</code>	$\rcorner$	<code>\rcorner</code>
$\ulcorner$	<code>\ulcorner</code>	$\urcorner$	<code>\urcorner</code>
$\llcorner$	<code>\llcorner</code>	$\lrcorner$	<code>\lrcorner</code>

TABLE 93: Variable-sized Delimiters

$\downarrow$	$\Downarrow$	<code>\downarrow</code>	$\Downarrow$	<code>\Downarrow</code>	$[$	$[$	$]$	$]$	
$\langle$	$\rangle$	<code>\langle</code>	$\rangle$	<code>\rangle</code>	$ $	$ ^*$	$\ $	$\ $	<code>\ </code>
$\lceil$	$\rceil$	<code>\lceil</code>	$\rceil$	<code>\rceil</code>	$\uparrow$	$\uparrow$	<code>\uparrow</code>	$\Uparrow$	<code>\Uparrow</code>
$\lfloor$	$\rfloor$	<code>\lfloor</code>	$\rfloor$	<code>\rfloor</code>	$\updownarrow$	$\updownarrow$	$\Updownarrow$	$\Updownarrow$	<code>\Updownarrow</code>
$($	$)$	$($	$)$	$)$	$\{$	$\{$	$\}$	$\}$	<code>\}</code>
$/$	$\backslash$	$/$	$\backslash$	<code>\backslash</code>					

When used with `\left` and `\right`, these symbols expand to the height of the enclosed math expression. Note that `\vert` is a synonym for `|`, and `\Vert` is a synonym for `\|`.

* e-TeX provides a `\middle` analogue to `\left` and `\right` that can be used to make an internal “`|`” expand to the height of the surrounding `\left` and `\right` symbols. A similar effect can be achieved in conventional L^AT_EX using the `braket` package.

TABLE 94: Large, Variable-Sized Delimiters

$\int$	$\int$	<code>\lmoustache</code>	$\int$	$\int$	<code>\rmoustache</code>	$($	$($	<code>\lgroup</code>	$)$	$)$	<code>\rgroup</code>
$ $	$ $	<code>\arrowvert</code>	$\ $	$\ $	<code>\Arrowvert</code>	$ $	$ $	<code>\bracevert</code>			

These symbols *must* be used with `\left` and `\right`. The `mathabx` package, however, redefines `\lgroup` and `\rgroup` so that those symbols can work without `\left` and `\right`.

TABLE 95: Variable-Sized stmaryrd Delimiters

$\llbracket$	$\llbracket$	<code>\llbracket</code>	$\rrbracket$	<code>\rrbracket</code>
--------------	--------------	-------------------------	--------------	-------------------------

TABLE 96: mathabx Variable-Sized Delimiters

$\llbracket$	$\llbracket$	<code>\lbbbrack</code>	$\rrbracket$	<code>\rbbbrack</code>
$\lfilet$	$\lfilet$	<code>\lfilet</code>	$\rfilet$	<code>\rfilet</code>
$ $	$ $	<code>\thickvert</code>	$\ $	<code>\vvvert</code>

TABLE 97: `textcomp` Text-Mode Delimiters

$\langle$	<code>\textlangle</code>	$\rangle$	<code>\textrangle</code>
$\llbracket$	<code>\textlbrackdbl</code>	$\rrbracket$	<code>\textrbrackdbl</code>
$\{$	<code>\textlquill</code>	$\}$	<code>\textrquill</code>

TABLE 98: Math-Mode Accents

$\acute{a}$	<code>\acute{a}</code>	$\check{a}$	<code>\check{a}</code>	$\grave{a}$	<code>\grave{a}</code>	$\tilde{a}$	<code>\tilde{a}</code>
$\bar{a}$	<code>\bar{a}</code>	$\ddot{a}$	<code>\ddot{a}</code>	$\hat{a}$	<code>\hat{a}</code>	$\vec{a}$	<code>\vec{a}</code>
$\breve{a}$	<code>\breve{a}</code>	$\dot{a}$	<code>\dot{a}</code>	$\mathring{a}$	<code>\mathring{a}</code>		

Also note the existence of `\imath` and `\jmath`, which produce dotless versions of “*i*” and “*j*”. (See Table 109 on page 33.) These are useful when the accent is supposed to replace the dot. For example, “`\hat{\imath}`” produces a correct “ $\hat{i}$ ”, while “`\hat{i}`” would yield the rather odd-looking “ $\hat{i}$ ”.

TABLE 99: $\mathcal{AMS}$ Math-Mode Accents

$\dddot{a}$	<code>\dddot{a}</code>	$\ddddot{a}$	<code>\ddddot{a}</code>
-------------	------------------------	--------------	-------------------------

These accents are also provided by the `mathabx` package.

TABLE 100: `yhmath` Math-Mode Accents

$\mathring{a}$	<code>\ring{a}</code>
----------------	-----------------------

This symbol is largely obsolete, as standard $\text{\LaTeX 2}_{\epsilon}$ has supported `\mathring` since June, 1998 [L^AT₉₈].

TABLE 101: Extensible Accents

$\widetilde{abc}$	<code>\widetilde{abc}</code> *	$\widehat{abc}$	<code>\widehat{abc}</code> *
$\overleftarrow{abc}$	<code>\overleftarrow{abc}</code>	$\overrightarrow{abc}$	<code>\overrightarrow{abc}</code>
$\overline{abc}$	<code>\overline{abc}</code>	$\underline{abc}$	<code>\underline{abc}</code>
$\overbrace{abc}$	<code>\overbrace{abc}</code>	$\underbrace{abc}$	<code>\underbrace{abc}</code>
$\sqrt{abc}$	<code>\sqrt{abc}</code>	$\sqrt[n]{abc}$	<code>\sqrt[n]{abc}</code>

* Made more extensible by the `yhmath` package.

TABLE 102: `yhmath` Extensible Accents

$\wideparen{abc}$	<code>\wideparen{abc}</code>	$\widetriangle{abc}$	<code>\widetriangle{abc}</code>
$\widetilde{\mathring{abc}}$	<code>\widetilde{\mathring{abc}}</code>		

TABLE 103: $\mathcal{AMS}$ Extensible Accents

$\overleftrightarrow{abc}$	<code>\overleftrightharrow{abc}</code>	$\overleftarrow{abc}$	<code>\underleftrightharrow{abc}</code>
$\overleftarrow{abc}$	<code>\underleftarrow{abc}</code>	$\overrightarrow{abc}$	<code>\underrightharrow{abc}</code>

The following are a sort of “reverse accent” in that the argument text serves as a superscript to the arrow. In addition, the optional first argument (not shown) serves as a subscript to the arrow. See the Short Math Guide for L^AT_EX [Dow00] for further examples.

$\overleftarrow{abc}$	<code>\xleftarrow{abc}</code>	$\overrightarrow{abc}$	<code>\xrightarrow{abc}</code>
-----------------------	-------------------------------	------------------------	--------------------------------

TABLE 104: `mathabx` Extensible Accents

$\overbrace{abc}$	<code>\overbrace{abc}</code>	$\overline{abc}$	<code>\widebar{abc}</code>
$\overgroup{abc}$	<code>\overgroup{abc}</code>	$\widetilde{abc}$	<code>\widecheck{abc}</code>
$\underbrace{abc}$	<code>\underbrace{abc}</code>	$\widehat{abc}$	<code>\wideparen{abc}</code>
$\undergroup{abc}$	<code>\undergroup{abc}</code>	$\overset{\circ}{abc}$	<code>\widering{abc}</code>
$\overrightarrow{abc}$	<code>\widearrow{abc}</code>		

The braces shown for `\overbrace` and `\underbrace` appear in their minimum size. They can expand arbitrarily wide, however.

TABLE 105: `esvect` Extensible Accents

$\overrightarrow{abc}$	<code>\vv{abc}</code> with package option a
$\overrightarrow{abc}$	<code>\vv{abc}</code> with package option b
$\overrightarrow{abc}$	<code>\vv{abc}</code> with package option c
$\overrightarrow{abc}$	<code>\vv{abc}</code> with package option d
$\overrightarrow{abc}$	<code>\vv{abc}</code> with package option e
$\overrightarrow{abc}$	<code>\vv{abc}</code> with package option f
$\overrightarrow{abc}$	<code>\vv{abc}</code> with package option g
$\overrightarrow{abc}$	<code>\vv{abc}</code> with package option h

`esvect` also defines a `\vv*` macro which is used to typeset arrows over vector variables with subscripts. See the `esvect` documentation for more information.

TABLE 106: Dots

$\cdot$	<code>\cdotp</code>	$:$	<code>\colon*</code>	$\cdot$	<code>\ldotp</code>	$\vdots$	<code>\vdots</code>
$\cdots$	<code>\cdots</code>	$\ddots$	<code>\ddots</code>	$\dots$	<code>\ldots</code>		

* While “:” is valid in math mode, `\colon` uses different surrounding spacing. See Section 7.3 and the Short Math Guide for L^AT_EX [Dow00] for more information on math-mode spacing.

TABLE 107: $\mathcal{AMS}$ Dots

$\cdots$	<code>\dotsb</code>	$\cdots$	<code>\dotsi</code>	$\cdots$	<code>\dotso</code>
$\cdots$	<code>\dotsc</code>	$\cdots$	<code>\dotsm</code>		

The $\mathcal{AMS}$ dot symbols are named according to their intended usage: `\dotsb` between pairs of binary operators/relations, `\dotsc` between pairs of commas, `\dotsi` between pairs of integrals, `\dotsm` between pairs of multiplication signs, and `\dotso` between other symbol pairs.

TABLE 108: yhmath Dots

$\ddots$	<code>\adots</code>
----------	---------------------

TABLE 109: Miscellaneous L^AT_EX 2_ε Symbols

* Put “`\DeclareMathAlphabet{\mathpzc}{OT1}{pzc}{m}{it}`” in your document’s preamble to make `\mathpzc` typeset its argument in Zapf Chancery.

[†] The `mathbbol` package defines some additional blackboard bold characters: parentheses, square brackets, angle brackets, and—if the `bbgreekl` option is passed to `matbbol`—Greek letters. For instance, “ $\llbracket (\alpha\beta\gamma) \rrbracket$ ” is produced by “`\mathbf{ABCdef123}`”.

4 Science and technology symbols

This section lists symbols that are employed in various branches of science and engineering (and, because we were extremely liberal in our classification, astrology, too).

TABLE 119: wasysym Electrical and Physical Symbols

$\sim$ `\AC` $\approx$ `\VHF` $\sim\sim\sim$ `\photon` $\approx$ `\HF` ∞ `\gluon`

TABLE 120: ifsym Pulse Diagram Symbols

$\lrcorner$ `\FallingEdge` $\llcorner$ `\LongPulseLow` $\lrcorner$ `\PulseLow` $\llcorner$ `\ShortPulseHigh`
 $\llcorner$ `\LongPulseHigh` $\llcorner$ `\PulseHigh` $\lrcorner$ `\RaisingEdge` $\lrcorner$ `\ShortPulseLow`

In addition, within `\textifsym{...}`, the following codes are valid:

$_$ `l` $_$ `m` $_$ `h` $_$ `d` $\langle$ `<` $\rangle$ `>`
 $_$ `L` $_$ `M` $_$ `H` $_$ `D` $\langle$ `<<` $\rangle$ `>>`

This enables one to write “`\textifsym{mm<DDD>mm}`” to get “” or “`\textifsym{L|H|L|H|L}`” to get “”.

Finally, `\textifsym` supports the display of segmented digits, as would appear on an LCD: “`\textifsym{-123.456}`” produces “- 123.456”. “`\textifsym{b}`” outputs a blank with the same width as an “8”.

TABLE 121: ar Aspect Ratio Symbol

$\mathcal{R}$ `\AR`

TABLE 122: textcomp Text-Mode Science and Engineering Symbols

$^{\circ}\text{C}$ `\textcelsius` $\text{\text{U}}$ `\textmho` μ `\textmu` Ω `\textohm`

☹	\STX	■	\BS	♫	\SO	␣	\DCd	→	\SUB		\splitvert
♥	\ETX	○	\HT	⚙	\SI	§	\NAK	←	\ESC	△	\DEL
♦	\EOT	▣	\LF	▶	\DLE	—	\SYN	⌞	\FS		
♣	\ENQ	♂	\VT	◀	\DCa	‡	\ETB	↔	\GS		
♠	\ACK	♀	\FF	‡	\DCb	↑	\CAN	▲	\RS		

SOH, STX, ETX, . . . , US are the names of ASCII characters 1–31. DEL is the name of ASCII character 127. \splitvert doesn’t correspond to a control character but is merely the “|” character shown IBM style.

These characters must be entered with the `ascii` font in effect, for example, “{\ascii\STX}”. See the `ascii` package documentation for more information.

5 Dingbats

Dingbats are symbols such as stars, arrows, and geometric shapes. They are commonly used as bullets in itemized lists or, more generally, as a means to draw attention to the text that follows.

The `pifont` dingbat package warrants special mention. Among other capabilities, `pifont` provides a $\text{\LaTeX}$ interface to the Zapf Dingbats font (one of the standard 35 PostScript fonts). However, rather than name each of the dingbats individually, `pifont` merely provides a single `\ding` command, which outputs the character that lies at a given position in the font. The consequence is that the `pifont` symbols can't be listed by name in this document's index, so be mindful of that fact when searching for a particular symbol.

The ifsym documentation points out that one can use `\rlap` to combine some of the above into useful, new symbols. For example, `\BigCircle` and `\FilledSmallCircle` combine to give “ $\bigcirc$ ”. Likewise, `\Square` and `\Cross` combine to give “ $\boxtimes$ ”. See Section 7.2 for more information about constructing new symbols out of existing symbols.

6 Other symbols

The following are all the symbols that didn't fit neatly or unambiguously into any of the previous sections. (Do weather symbols belong under "Science and technology"? Should dice be considered "mathematics"?) While some of the tables contain clearly related groups of symbols (e.g., musical notes), others represent motley assortments of whatever the font designer felt like drawing.

	<code>\Irritant</code>		<code>\PaperPortrait</code>		<code>\Telephone</code>
	<code>\StrokeOne</code>		<code>\StrokeThree</code>		<code>\StrokeFive</code>
	<code>\StrokeTwo</code>		<code>\StrokeFour</code>		

In addition, `\Cube{1}... \Cube{6}` produce dice with the corresponding number of spots:      

7 Additional Information

Unlike the previous sections of this document, Section 7 does not contain new symbol tables. Rather, it provides additional help in using the Comprehensive L^AT_EX Symbol List. First, it draws attention to symbol names used by multiple packages. Next, it provides some guidelines for finding symbols and gives some examples regarding how to construct missing symbols out of existing ones. Then, it comments on the spacing surrounding symbols in math mode. After that, it presents an ASCII and Latin 1 quick-reference guide, showing how to enter all of the standard ASCII/Latin 1 symbols in L^AT_EX. And finally, it lists some statistics about this document itself.

7.1 Symbol Name Clashes

Unfortunately, a number of symbol names are not unique; they appear in more than one package. Depending on how the symbols are defined in each package, L^AT_EX will either output an error message or replace an earlier-defined symbol with a later-defined symbol. Table 181 presents a selection of name clashes that appear in this document.

Using multiple symbols with the same name in the same document—or even merely loading conflicting symbol packages—can be tricky, but, as evidenced by the existence of Table 181, not impossible. The general procedure is to load the first package, rename the conflicting symbols, and then load the second package. Examine the L^AT_EX source for this document (`symbols.tex`)—especially the `\savesymbol` and `\restoresymbol` macros and their subsequent usage—to see one possible way to handle symbol conflicts.

`txfonts` and `pxfonts` redefine a huge number of symbols—essentially, all of the symbols defined by `latexsym`, `textcomp`, the various $\mathcal{AMS}$ symbol sets, and L^AT_EX 2_ε itself. Similarly, `mathabx` redefines a vast number of math symbols in an attempt to improve their look. The `txfonts`, `pxfonts`, and `mathabx` conflicts are not listed in Table 181 because they are designed to be compatible with the symbols they replace. Table 182 on page 50 illustrates what “compatible” means in this context.

To use the new `txfonts`/`pxfonts` symbols without altering the document’s main font, merely reset the default font families back to their original values after loading one of those packages:

```
\renewcommand\rmdefault{cmr}
\renewcommand\sfddefault{cmss}
\renewcommand\ttdefault{cmtt}
```

7.2 Where can I find the symbol for ... ?

If you can’t find some symbol you’re looking for in this document, there are a few possible explanations:

- The symbol isn’t intuitively named. As a few examples, the command to draw dice is “`\Cube`”; a plus sign with a circle around it (“exclusive or” to computer engineers) is “`\oplus`”; and lightning bolts in fonts designed by German speakers may have “blitz” in their names. The moral of the story is to be creative with synonyms when searching the index.
- The symbol is defined by some package that I overlooked (or deemed unimportant). If there’s some symbol package that you think should be included in the Comprehensive L^AT_EX Symbol List, please send me e-mail at the address listed on the title page.
- The symbol isn’t defined in any package whatsoever.

Even in the last case, all is not lost. Sometimes, a symbol exists in a font, but there is no L^AT_EX binding for it. For example, the PostScript Symbol font contains a “`\l`” symbol, which may be useful for representing a carriage return, but there is no package for accessing that symbol (as far as I know). To produce an unnamed symbol, you need to switch to the font explicitly with L^AT_EX 2_ε’s low-level font commands [L^AT_EX 2_ε] and use T_EX’s primitive `\char` command [Knu86] to request a specific character number in the font.³

Symbols that do not exist in any font can sometimes be fabricated out of existing symbols. The L^AT_EX 2_ε source file `fontdef.dtx` contains a number of such definitions. For example, `\models` (see Table 40 on page 20) is defined in that file with:

```
\def\models{\mathrel{\joinrel=}}
```

³`pifont` defines a convenient `\Pisymbol` command for accessing symbols in PostScript fonts by number. For example, “`\Pisymbol{psy}{191}`” produces “`\l`”.

TABLE 182: Example of a Benign Name Clash

Symbol	Default (Computer Modern)	txfonts (Times Roman)
$\mathrel$	$\mathrel$	$\mathrel$
<code>\textrecipe</code>	$\mathrel$	$\mathrel$

where `\mathrel` and `\joinrel` are used to control the horizontal spacing. (See The $\TeX$ book [Knu86] for more information on those commands.)

With some simple pattern-matching, one can easily define a backward `\models` sign (“ $\models$ ”):

```
\def\ismodeledby{=\joinrel\mathrel{}}
```

In general, arrows/harpoons, horizontal lines (“ $=$ ”, “ $-$ ”, “`\relbar`”, and “`\Relbar`”), and the various math-extension characters can be combined creatively with miscellaneous other characters to produce a variety of new symbols. Of course, new symbols can be composed from *any* set of existing characters. For instance, $\LaTeX$ defines `\hbar` (“ $\hbar$ ”) as a bar character (`\mathchar'26`) followed by a backspace of 9 math units (`\mkern-9mu`), followed by the letter “h”:

```
\def\hbar{\mathchar'26\mkern-9mu h}
```

We can just as easily define other barred letters:

```
\def\bbar{\mathchar'26\mkern-9mu b}
\def\dbar{\mathchar'26\mkern-12mu d}
```

(The space after the “mu” is optional but is added for clarity.) `\bbar` and `\dbar` define “ $\bar{b}$ ” and “ $\bar{d}$ ”, respectively. Note that `\dbar` requires a greater backward math kern than `\bbar`; a -9μ kern would have produced the less-attractive “ $\bar{d}$ ” glyph.

To make composite symbols work properly within subscripts and superscripts, you may need to use $\TeX$ ’s `\mathchoice` primitive. `\mathchoice` evaluates one of four expressions, based on whether the current math style is display, text, script, or scriptscript. (See The $\TeX$ book [Knu86] for a more complete description.) For example, the following $\LaTeX$ code—posted to `comp.text.tex` by Torsten Bronger—composes a sub/superscriptable “ $\top$ ” symbol out of `\top` and `\bot` (“ $\top$ ” and “ $\perp$ ”):

```
\def\topbotatom#1{\hbox{\hbox to 0pt{#1\bot$\hss}$#1\top$}}
\newcommand*\topbot{\mathrel{\mathchoice{\topbotatom\displaystyle}
{\topbotatom\textstyle}
{\topbotatom\scriptstyle}
{\topbotatom\scriptscriptstyle}}}
```

The following is another example that uses `\mathchoice` to construct symbols in different math modes. The code defines a principal value integral symbol, which is an integral sign with a line through it.

```
\def\Xint#1{\mathchoice
{\XXint\displaystyle\textstyle{#1}}%
{\XXint\textstyle\scriptstyle{#1}}%
{\XXint\scriptstyle\scriptscriptstyle{#1}}%
{\XXint\scriptscriptstyle\scriptscriptstyle{#1}}%
\!\int}
\def\XXint#1#2#3{\setbox0=\hbox{#1{#2#3}\int}$}
\center{\hbox{#2#3}}\kern-.5\wd0}}
\def\ddashint{\Xint=}
\def\dashint{\Xint-}
```

`\dashint` produces a single-dashed integral sign (“ $\int$ ”), while `\ddashint` produces a double-dashed one (“ $\!\!\!\int$ ”). The same technique can be used to produce, for example, clockwise and counterclockwise contour integrals. (Search the `comp.text.tex` archives for a post by Donald Arseneau that says exactly how.) The preceding code was taken verbatim from the UK T_EX Users’ Group FAQ (<http://www.tex.ac.uk/faq>).

Sometimes, however, `amstext`’s `\text` macro is all that is necessary to make composite symbols appear correctly in subscripts and superscripts, as in the following definitions of `\neswarrow` (“ $\nearrow$ ”) and `\nwsearrow` (“ $\nwarrow$ ”):⁴

```
\newcommand{\neswarrow}{\mathrel{\text{$\nearrow$\llap{$\swarrow$}}}}
\newcommand{\nwsearrow}{\mathrel{\text{$\nwarrow$\llap{$\searrow$}}}}
```

`\text` resembles L^AT_EX’s `\mbox` command but shrinks its argument appropriately when used within a subscript or superscript. `\llap` (“left overlap”) and its counterpart, `\rlap` (“right overlap”), appear frequently when creating composite characters. `\llap` outputs its argument to the left of the current position, overlapping whatever text is already there. Similarly, `\rlap` overlaps whatever text would normally appear to the right of its argument. For example, “`A\llap{B}`” and “`\rlap{A}B`” each produce “**B**”. However, the result of the former is the width of “A”, and the result of the latter is the width of “B”—`\llap{...}` and `\rlap{...}` take up zero space.

As another example, `fontdef.dtx` composes the `\ddots` symbol (see Table 106 on page 33) out of three periods, raised 7 pt., 4 pt., and 1 pt., respectively:

```
\def\ddots{\mathinner{\mkern1mu\raise7\p@
\ vbox{\kern7\p@\hbox{.}}\mkern2mu
\raise4\p@\hbox{.}\mkern2mu\raise\p@\hbox{.}\mkern1mu}}
```

`\p@` is a L^AT_EX 2_ε shortcut for “pt” or “1.0pt”. The remaining commands are defined in The T_EXbook [Knu86]. To draw a version of `\ddots` with the dots going along the opposite diagonal, we merely have to reorder the `\raise7\p@`, `\raise4\p@`, and `\raise\p@`:

```
\makeatletter
\def\revddots{\mathinner{\mkern1mu\raise\p@
\ vbox{\kern7\p@\hbox{.}}\mkern2mu
\raise4\p@\hbox{.}\mkern2mu\raise7\p@\hbox{.}\mkern1mu}}
\makeatother
```

(The `\makeatletter` and `\makeatother` commands are needed to coerce L^AT_EX into accepting “@” as part of a macro name.) `\revddots` is essentially identical to the `yhmath` package’s `\adots` command.

A more complex example of composing new symbols from existing symbols is the following definition of extensible `\overbracket`, `\underbracket`, `\overparenthesis`, and `\underparenthesis` symbols, taken from a `comp.text.tex` post by Donald Arseneau:

```
\makeatletter
\def\overbracket#1{\mathop{\vbox{\ialign{##\crr\noalign{\kern3\p@}
\downbracketfill\crr\noalign{\kern3\p@\nointerlineskip}
$\hfil\displaystyle{#1}\hfil$\crr}}\limits}
\def\underbracket#1{\mathop{\vtop{\ialign{##\crr
$\hfil\displaystyle{#1}\hfil$\crr\noalign{\kern3\p@\nointerlineskip}
\upbracketfill\crr\noalign{\kern3\p@}}}\limits}
\def\overparenthesis#1{\mathop{\vbox{\ialign{##\crr\noalign{\kern3\p@}
\downparenthfill\crr\noalign{\kern3\p@\nointerlineskip}
$\hfil\displaystyle{#1}\hfil$\crr}}\limits}
\def\underparenthesis#1{\mathop{\vtop{\ialign{##\crr
$\hfil\displaystyle{#1}\hfil$\crr\noalign{\kern3\p@\nointerlineskip}
\upparenthfill\crr\noalign{\kern3\p@}}}\limits}
\def\downparenthfill{$\m@th\bracedl\leaders\vrule\hfill\bracerd$}
\def\upparenthfill{$\m@th\braceru\leaders\vrule\hfill\braceru$}
\def\upbracketfill{$\m@th\makesm@sh{\llap{\vrule\@height3\p@\@width.7\p@}}\%
\leaders\vrule\@height.7\p@\hfil}
```

⁴Note that if your goal is to typeset commutative diagrams, then you probably want to use X_y-pic.

```
\DeclareMathOperator{\atan}{atan}
\DeclareMathOperator*{\lcm}{lcm}
```

The difference between `\DeclareMathOperator` and `\DeclareMathOperator*` involves the handling of subscripts. With `\DeclareMathOperator*`, subscripts are written beneath log-like symbols in display style and to the right in text style. This is useful for limit operators (e.g., `\lim`) and functions that tend to map over a set (e.g., `\min`). In contrast, `\DeclareMathOperator` tells $\text{\TeX}$ that subscripts should always be displayed to the right of the operator, as is common for functions that take a single parameter (e.g., `\log` and `\cos`). Table 185 contrasts symbols declared with `\DeclareMathOperator` and `\DeclareMathOperator*` in both text style ($\$...\$$) and display style ($\backslash[\dots]\backslash$).

TABLE 185: Defining new log-like symbols

Declaration function	$\$ \text{\newlogsym}\{p \text{ \in } P\} \$$	$\backslash[\text{\newlogsym}\{p \text{ \in } P\} \backslash]$
<code>\DeclareMathOperator</code>	$\text{\newlogsym}_{p \in P}$	$\text{\newlogsym}_{p \in P}$
<code>\DeclareMathOperator*</code>	$\text{\newlogsym}_{p \in P}$	$\text{\newlogsym}_{p \in P}$

7.4 ASCII and Latin 1 quick reference

Table 186 on the following page amalgamates data from various other tables in this document into a convenient reference for $\text{\LaTeX} 2_{\epsilon}$ typesetting of ASCII characters, i.e., the characters available on a typical⁵ computer keyboard. The first two columns list the character’s ASCII code in decimal and hexadecimal. The third column shows what the character looks like. The fourth column lists the $\text{\LaTeX} 2_{\epsilon}$ command to typeset the character as a text character. And the fourth column lists the $\text{\LaTeX} 2_{\epsilon}$ command to typeset the character within a `\texttt{...}` command (or, more generally, when `\ttfamily` is in effect).

The following are some additional notes about the contents of Table 186:

- " is not available in the OT1 font encoding.
- The characters “<”, “>”, and “|” do work as expected in math mode, although they produce, respectively, “|”, “|”, and “|” in text mode.⁶ Hence, $\$<\$, \$>\$,$ and $\$|\$$ serve as a terser alternative to `\textless`, `\textgreater`, and `\textbar`. Note that for typesetting metavariables many people prefer `\texttriangle` and `\textriangle` to `\textless` and `\textgreater`, i.e., “ $\langle filename \rangle$ ” instead of “ $<filename >$ ”.
- The various `\char` commands within `\texttt` are necessary only in the OT1 font encoding. In other encodings (e.g., T1), commands such as `\{`, `\}`, `\_`, and `\textbackslash` all work properly.
- `\textasciicircum` can be used instead of `\^{}{}`, and `\textasciitilde` can be used instead of `\~{}{}`. For typesetting tildes in URLs and Unix filenames, some people prefer `\sim` (see Table 40 on page 20), which produces a larger symbol. However, a superior approach for typesetting URLs is to use the `url` package, which has a number of additional nice features.
- The IBM version of ASCII characters 1 to 31 can be typeset using the `ascii` package. See Table 132 on page 38.
- To replace ‘ and ’ with the more computer-like (and more visibly distinct) ` and ' within a `verbatim` environment, use the `upquote` package. Outside of `verbatim`, you can use `\char18` and `\char13` to get the modified quote characters. (The former is actually a grave accent.)

Similar to Table 186, Table 187 on page 55 is an amalgamation of data from other tables in this document. While Table 186 shows how to typeset the 7-bit ASCII character set, Table 187 shows the Latin 1 (Western European) character set, also known as ISO-8859-1.

The following are some additional notes about the contents of Table 187:

⁵typical for the United States, at least

⁶Donald Knuth didn’t think such symbols were important outside of mathematics, so he omitted them from the OT1 font encoding.

TABLE 186: L^AT_EX 2_ε ASCII Table

Dec	Hex	Char	Body text	\texttt	Dec	Hex	Char	Body text	\texttt
33	21	!	!	!	62	3E	>	\textgreater	>

⋮	⋮	⋮	⋮	⋮	122	7A	z	z	z
57	39	9	9	9	123	7B	{	\{	\char'\{
58	3A	:	:	:	124	7C		\textbar	
59	3B	;	;	;	125	7D	}	\}	\char'\}
60	3C	<	\textless	<	126	7E	~	\~{}	\~{}
61	3D	=	=	=					

- A “(tc)” after a symbol name means that the `textcomp` package must be loaded to access that symbol. A “(T1)” means that the symbol requires the T1 font encoding. The `fontenc` package can change the font encoding document-wide.
- Many of the `\text...` accents can also be produced using the accent commands shown in Table 11 on page 10 plus an empty argument. For instance, `\={}` is essentially the same as `\textasciimacron`.
- The commands in the “L^AT_EX 2_ε” columns work both in body text and within a `\texttt{...}` command (or, more generally, when `\ttfamily` is in effect).
- Microsoft® Windows® normally uses a superset of Latin 1 called “CP1252” (Code Page 1252). CP1252 adds codes in the range 128–159 (hexadecimal 80–9F), including characters such as dashes, daggers, and quotation marks. If there’s sufficient interest, a future version of the Comprehensive L^AT_EX Symbol List may include a CP1252 table.

While too large to incorporate into this document, a listing of ISO 8879:1986 SGML/XML character entities and their L^AT_EX equivalents is available from <http://www.bitjungle.com/~isoent/>. Some of the characters presented there make use of `isoent`, a L^AT_EX 2_ε package (available from the same URL) that fakes some of the missing ISO glyphs using the L^AT_EX `picture` environment.⁷

7.5 About this document

History David Carlisle wrote the first version of this document in October, 1994. It originally contained all of the native L^AT_EX symbols (Tables 25, 33, 40, 63, 79, 81, 93, 94, 98, 101, 109, and a few tables that have since been reorganized) and was designed to be nearly identical to the tables in Chapter 3 of Leslie Lamport’s book [Lam86]. Even the table captions and the order of the symbols within each table matched! The *AMS*

⁷`isoent` is not featured in this document, because it is not available from CTAN and because the faked symbols are not “true” characters; they exist in only one size, regardless of the body text’s font size.

symbols (Tables 26, 41, 42, 66, 67, 82, 85, 90, and 110) and an initial Math Alphabets table (Table 118) were added thereafter. Later, Alexander Holt provided the `stmaryrd` tables (Tables 27, 35, 43, 69, 76, and 91).

In January, 2001, Scott Pakin took responsibility for maintaining the symbol list and has since implemented a complete overhaul of the document. The result, now called, “The Comprehensive L^AT_EX Symbol List”, includes the following new features:

- the addition of a handful of new math alphabets, dozens of new font tables, and thousands of new symbols
- the categorization of the symbol tables into body-text symbols, mathematical symbols, science and technology symbols, dingbats, and other symbols, to provide a more user-friendly document structure
- an index, table of contents, and a frequently-requested symbol list, to help users quickly locate symbols
- symbol tables rewritten to list the symbols in alphabetical order
- appendices to provide additional information relevant to using symbols in L^AT_EX
- tables showing how to typeset all of the characters in the ASCII and Latin 1 font encodings

Furthermore, the internal structure of the document has been completely altered from David’s original version. Most of the changes are geared towards making the document easier to extend, modify, and reformat.

Build characteristics Table 188 lists some of this document’s build characteristics. Most important is the list of packages that L^AT_EX couldn’t find, but that `symbols.tex` otherwise would have been able to take advantage of. Complete, prebuilt versions of this document are available from CTAN (<http://www.ctan.org/> or one of its many mirror sites) in the directory `tex-archive/info/symbols/comprehensive`. Table 189 shows the package date (specified in the `.sty` file with `\ProvidesPackage`) for each package that was used to build this document and that specifies a package date. Packages are not listed in any particular order in either Table 188 or 189.

TABLE 188: Document Characteristics

Characteristic	Value
Source file:	<code>symbols.tex</code>
Build date:	October 8, 2002
Symbols documented:	2590
Packages included:	<code>textcomp</code> <code>latexsym</code> <code>amssymb</code> <code>stmaryrd</code> <code>euscript</code> <code>wasysym</code> <code>pifont</code> <code>mathcomp</code> <code>marvosym</code> <code>manfnt</code> <code>bbding</code> <code>ifsym</code> <code>tipa</code> <code>wsuipa</code> <code>ulsy</code> <code>ar</code> <code>txfonts</code> <code>mathabx</code> <code>fclfont</code> <code>ascii</code> <code>dingbat</code> <code>skull</code> <code>eurosym</code> <code>esvect</code> <code>yfonts</code> <code>yhmath</code> <code>esint</code> <code>accents</code> <code>mathrsfs</code> <code>zapfchan</code> <code>bbold</code> <code>dsfont</code> <code>bbm</code>
Packages omitted:	<i>none</i>

TABLE 189: Package versions used in the preparation of this document

Index

If you're having trouble locating a symbol, try looking under “T” for “\text...”. Many text-mode commands begin with that prefix. Also, accents are shown over/under a black box, e.g., “■” for “\’”.

Some symbol entries appear to be listed repeatedly. This happens when multiple packages define identical (or nearly identical) glyphs with the same symbol name.⁸
